JURNAL 13

Cara Pengerjaan:

```
// untuk menyisipkan disebelah kanan
else if (insertValue.compareTo(data) > 0) {

// jika node kanan masih null
if (rightNode == null) {

// maka akan disisipkan node baru di sebelah kanan nya
rightNode = new TreeNode<E>(insertValue);
} else {

// tapi jika sebelah kanan nya tidak kosong maka akan menyisipkan di sebelah
// kanan secara rekursif
rightNode.insert(insertValue);
}

}

}

}

}
```

Tree:

```
public class Tree<E extends Comparable<E>>> {
   private TreeNode<E> root;
   public Tree() {
       root = null;
   public void insertNode(E insertValue) {
       if (root == null) {
           root = new TreeNode<E>(insertValue); // untuk buat node root
        } else {
           root.insert(insertValue); // untuk panggil method insert nya
   }
   // method untuk memulai preorder
   public void preorderTraversal() {
       preorderHelper(root);
   private void preorderHelper(TreeNode<E> node) {
        if (node == null) {
           return;
       System.out.printf(format:"%s ", node.getData()); // print data
       preorderHelper(node.getLeftNode()); // menelusuri subtree kiri
       preorderHelper(node.getRightNode()); // menelusuri subtree kanan
   public void inorderTraversal() {
       inorderHelper(root);
   private void inorderHelper(TreeNode<E> node) {
       if (node == null) {
```

```
inorderHelper(node.getLeftNode()); // menelusuri subtree kiri
   System.out.printf(format:"%s ", node.getData()); // print data
   inorderHelper(node.getRightNode()); // menelusuri subtree kanan
public void postorderTraversal() {
   postorderHelper(root);
private void postorderHelper(TreeNode<E> node) {
   if (node == null) {
   postorderHelper(node.getLeftNode()); // menelusuri subtree kiri
   postorderHelper(node.getRightNode()); // menelusuri subtree kanan
   System.out.printf(format:"%s ", node.getData()); // print
public void searchBST(E key) {
   boolean hasil = searchBSTHelper(root, key);
   if (hasil)
       System.out.println("Data ditemukan " + key);
       System.out.println("Data tidak ditemukan " + key);
public boolean searchBSTHelper(TreeNode<E> node, E key) {
    if (node != null) {
        if (key.equals(node.getData()))
           result = true;
        else if (key.compareTo(node.getData()) < 0)
           result = searchBSTHelper(node.getLeftNode(), key);
           result = searchBSTHelper(node.getRightNode(), key);
```

```
else if (key.compareTo(node.getData()) < 0)
result = searchBSTHelper(node.getLeftNode(), key);
else
result = searchBSTHelper(node.getRightNode(), key);
}
return result;
}
return result;
}
```

Main:

```
Main.java 🗦 😭 Main
       public static void main(String[] args) {
           Tree<Character> tree = new Tree<>();
           System.out.println(x:"Inserting the following values: ");
           char[] values = { 'F', 'E', 'H', 'D', 'G', 'C', 'B', 'H', 'K', 'J' };
            for (char value : values) {
               System.out.printf(format:"%c ", value);
                tree.insertNode(value);
           System.out.printf(format:"%n%nPreorder traversal%n");
           tree.preorderTraversal();
           System.out.printf(format:"%n%nInorder traversal%n");
           tree.inorderTraversal();
            System.out.printf(format:"%n%nPostorder traversal%n");
            tree.postorderTraversal();
           System.out.println();
           tree.searchBST(key:'K');
           tree.searchBST(key:'A');
```
